A NOTE ON ETHICS / LEGALITY

- UNSW hosting this course is an extremely important step forward.
- We expect a high level of professionalism from you, meaning:
 - Respect the property of other universities
 - Always abide by the law and regulations
 - Be considerate of others to ensure everyone has an equal learning experience
 - Always check that you have written permission before performing a security test on a system

Always err on the side of caution. If you are unsure about

“NOT - A - HOMEWORK”

Add WeChat edu_assist_pro

HTTP

<https://eduassistpro.github.io/>

- Client opens a connection to the server
- Client and server now have a bidirectional communication stream
- Requests and responses sent over this channel

The Problem with HTTP

<https://eduassistpro.github.io/>

- The requests are sent in cleartext
- A malicious party (Man in the middle) can intercept the path of the requests/responses and read/modify them
- This could be:
 - A router routing the packet
 - An attacker on the client's local network

HTTPS

<https://eduassistpro.github.io/>

- Transport Layer connection established on top of TCP
- Client and server now have a communication stream
- TLS was previously known as Secure Sockets Layer (SSL)

HTTPS

- But how do we know the server is the one we intend to connect to?
- During the TLS handshake, the server sends a certificate indicating the intended domain
- The browser (https://eduassistpro.github.io/) shows a privacy warning

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

How do certificates work?

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat [edu_assist_pro](#)

- A certificate a server has control of a domain
- The CA issues the server a p certificate and corresponding private key
- CAs themselves may be signed by another CA, resulting in a “certificate chain” with the root certificate authority at the top
- Operating Systems come loaded with a set of trusted root CAs

Can HTTPS be MiTM'd?

- A malicious attacker can sit between client/server as a proxy
- However, it will not be able to present a certificate signed by a trusted authority
- Best it can do is present a "self-signed" certificate, which will result in a warning to the client

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

How to be secure?

- Don't serve any content over HTTP, redirect to HTTPS
- HOWEVER, this is still problematic as the initial HTTP request is still susceptible to MITM

<https://eduassistpro.github.io/>

OVERVIEW

Authentication → Session Management → Access Control
Assignment Project Exam Help

Is the user
who they claim
to be?

Add WeChat edu_assist_pro

I recognize this SESSIONID. You are user ABCD
You have 1 item in your cart, item XYZ
You are not currently logged in.

ANATOMY OF A COOKIE

The main way we store session information is in a cookie.

Server → Client

```
Set-Cookie: SSID=abcdef;                               an 2020 20:20:20 GMT;  
Secure; HttpOnly
```

name=value	the data t	
Domain	specifies	that the cookie belongs
to		
Expires	date when	d be deleted
Secure	only send the cookie over	secure connections
(i.e. HTTPS)		
HttpOnly	disable access to the cookie from	JavaScript

<https://eduassistpro.github.io/>

Add WeChat [edu_assist_pro](#)

Client → Server

```
Cookie: country=aus; SSID=abcdef
```

ATTACKING SESSIONS

- Session Creation

- How are sessions created? Can I fake my own session?
- Can I attack the PRNG, and generate my own cookie?
- Can I “fixate” a session?

Assignment Project Exam Help

- Session Handling / Tra

- Can I steal the c
- Can I steal the cookie through redirect
- What information does the site trust in

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

- Session Cleanup

- What happens when I click “log out”?
- Under what conditions is a session actually destroyed? What happens then?
- Do sessions time out correctly?

TYPES OF (WEB) ACCESS CONTROL

Assignment Project Exam Help

Security through obscurity

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Rule-based acc

RBAC: HORIZONTAL vs VERTICAL

- **Horizontal access control** is making sure one user can't access a different user's data without permission
 - `http://bank.com/admin.php?id=12078`
- **Vertical access control** is making sure only administrative users can access administrative content
- Attacking vertical access control is commonly known as privilege escalation
 - `http://bank.com/admin.php`

ATTACKING ACCESS CONTROL

METHOD 1: BYPASS ENTIRELY

[DEFENSIVE] SECURING YOUR SESSIONS

- Minimize your attack surface
 - Your session should be managed on the server side where possible, using a single session token.
- Mostly mechanical
 - Don't let people reuse tokens (URLs, HTTP, etc)
 - Don't let people re-use tokens properly, log out)
 - Don't let people generate tokens (secure PRNG, avoid rolling your own crypto, don't allow users to supply tokens).
- Attention to detail is **key**.
